

## Frontend Coding Exercise

The screenshots shown below are typical of those found in our SEO SaaS service and collectively correspond to the functionality for editing a client record in a tabbed interface. The first tab enables the user to change basic client details such as company name, business category and company URL. The second tab enables users to assign one or more locations to the client record.

For this exercise please try to recreate this tabbed interface using HTML, CSS and JavaScript and whatever other technologies you feel are appropriate. We're not concerned about the server side aspects of this (such as actually saving and retrieving client details).

We realise that your time is precious so please don't spend more than 2 hours on this exercise. We don't necessarily expect you to complete the exercise. We simply keen to get a sense of how you approach the problem and to gain a better understanding of your skills in the core technologies that are important to this role.

Assigned Locations

The locations in the table below are currently assigned to this client. You can un-assign them using the checkboxes in the Assigned column.

Assigned	Location	Address	City	Postal Code	Assigning Client
<input type="checkbox"/>	Location 1	123 Main St	London	SW1A 1AA	The Search Dawgs
<input type="checkbox"/>	Place 2	456 High St	Bristol	BS1 1AA	The Search Dawgs
<input type="checkbox"/>	Address 3	789 Old St	Brighton	BN1 1AA	The Search Dawgs
<input type="checkbox"/>	Spot 4	101 New St	Edin	BT1 1AA	The Search Dawgs

*Note: Bonus points for spotting the omission in the first screenshot!*
